

New things to test:

1. Fields now have a minimum width and height:
New fields – When creating a new field, make sure that you cannot resize the field below a certain minimum (the bottom right corner should remain in the field box)
Existing fields – If a field was created on the document before the new version was implemented, it will be displayed bigger in web app (with the minimum width and height).
2. Field name now appears in the middle of the field:
New fields – When creating a new field the field has no name and therefore nothing should change
Existing fields – Existing field name should appear in the center of the field box.
3. Field box style has changed: Make sure it looks good on all browser (corners are round and the is a little bit invisible).
4. Timed pop ups now appear after a certain delay. They shouldn't appear before the entire page has finished loading.
5. Existing fields that have been created on top of each other should be ordered from newest field to oldest (newer fields will be on the top of older ones).
*Make sure that both in Prepare with Cosign and Design with cosign, you can drag new fields on top of existing ones and it doesn't cause any troubles (mouse isn't "stuck").
6. Text on buttons in the bottom of the sign page should be centered (both for Prepare with CoSign and Sign with CoSign). Check this both in SP2010 and SP2013
